

CLAY COMMONS

New South Wales

Austral Bricks Clay Commons

Austral Bricks is Australia’s leading manufacturer of advanced brick and clay products. With display centres in every State you can now choose from a wide range of quality bricks designed for even the smallest jobs.

Austral’s clay commons include Dry Pressed Bricks, Wirecut Bricks and our certified engineering strength bricks - Mighty Bricks™.

Make a difference with Austral Bricks Clay Commons

Austral Bricks clay commons are strong, easy to handle and available in many different sizes.

Designed for today’s building and design environment, our bricks can make all the difference when it comes to meeting your construction needs.

*Universal & Exposure Commons have one face and one header smooth and the other face and header wire cut.
#FRL’s shown in the table are test results where the structural adequacy is specific to a 3 metre high wall restrained on the top and bottom.
The design of fire rated walls should be checked by a qualified structural engineer. All specifications are nominal.

Austral reserves the right to change specifications without notice - June 2016. Check the Austral Bricks website for updated results.

All testing is carried out in Austral Bricks’ NATA accredited laboratory to Australian Standards AS/NZS4455 & AS/NZS4456.

Fire and acoustic tests are carried out by independent NATA accredited laboratories.

mighty bricks

Certified Engineering Strength Bricks

Austral Bricks special range of certified engineering strength bricks enables the structural engineer to achieve the full potential of the building design by delivering massive load bearing ability.

Austral Bricks has all ‘Mighty Bricks™’ certified by an independent testing authority with batch certificates being supplied to each project.

Austral Bricks recommends engineers and builders take special precautions to ensure a trouble-free project. MIGHTY BRICKS™ will only be supplied after acceptance of Austral Bricks’ terms and conditions in our order confirmation.

The Austral Brick Company has tested and certified the masonry products delivered under this contract fully in accordance with the governing industry standards. It is the onus of the recipient to ensure that the products are used in accordance with the relevant codes, and in particular with sections 2.6, 2.7 and 2.8 of the Australian Standard Masonry Structures AS3700 and the Earthquake Loading Code AS1170.4. If any doubt exists as to compliance, then the advice of a registered structural engineer experienced in masonry construction should be sought prior to construction.

Austral Bricks also recommends suitable quality control systems be implemented on site and be confirmed by testing to AS3700, Appendix C for special masonry.

†FRL’s shown in the table are test results where the structural adequacy is specific to a 3 metre high wall restrained on the top and bottom.

The design of fire rated walls should be checked by a qualified structural engineer.

#Using Austral Bricks MIGHTY BRICKS™ and M3 or M4 mortar in accordance with AS3700 this strength will be the minimum achieved.

**M3 and M4 mortar as per Table 11.1 AS3700.

Austral Bricks mark all MIGHTY BRICKS™ with blue tape to avoid on-site confusion.

All specifications are nominal. Austral bricks reserves the right to change specifications without notice - 2012.

strength of brickwork

The strength of brickwork is a function of the strength of the masonry unit combined with strength of the mortar. Typically, manufacturers provide the characteristic unconfined compressive strength of masonry units (bricks), f'_{uc} . It is from this value that the engineer derives the strength of masonry (wall), f'_m , appropriate to the unit type and strength with a particular mortar, using Section 3 of the Australian Standard for Masonry Structures, AS 3700.

Example: A 119mm high clay unit with an f'_{uc} of 50 MPa laid with full bed M4 mortar will achieve a characteristic unconfined strength of the masonry, f'_m of 16.1 MPa. The tables below provide the values for the strength of masonry that can be achieved using a 119mm high clay brick of a particular strength coupled with either M3 or M4 mortar.

Characteristic unconfined compressive strength of standard masonry, f'_m (MPa) for a 119mm high clay brick with full bed M3 mortar*

Characteristic Unconfined Compressive Strength of a Unit (brick) f'_{uc} (MPa)	10	20	25	30	40	50
Characteristic Unconfined Compressive Strength of a Unit (brick) f'_m (MPa)#	5.0	7.2	8.0	8.8	10.0	11.3

Characteristic unconfined compressive strength of standard masonry, f'_m (MPa) for a 119mm high clay brick with full bed M4 mortar*

Characteristic Unconfined Compressive Strength of a Unit (brick) f'_{uc} (MPa)	10	20	25	30	40	50
Characteristic Unconfined Compressive Strength of a Unit (brick) f'_m (MPa)#	7.2	10.1	11.4	12.4	14.5	16.1

Austral’s Mighty Bricks™ are marked with identifiable batch numbers and are tested in an independent laboratory with M3 and M4 mortars to provide certified values of f'_m .

*M3 and M4 mortar classifications as per Table 11.1 AS 3700.

The certified values demonstrate strengths that exceed the values published in this brochure.

Derived from Table 3.1 AS 3700, utilising a Kh factor of 1.14.

Fire resistance

Fire resistance levels are specified in the National Construction Code (NCC). This system provides an accurate method of predicting the ability of a wall to maintain its strength in a fire and to resist the spread of the fire. The fire resistance level (FRL) specifies the fire resistance periods (FRP) for structural adequacy, integrity and insulation. These components can be defined as:

- **Structural Adequacy** – The ability of a wall to continue to perform it’s structural function.
- **Integrity** – The ability of a wall to maintain its continuity and prevent the passage of flames and hot gases through cracks in the wall.

- **Insulation** – The ability of a wall to provide sufficient insulation, such that the side of the wall away from the fire does not exceed a predefined rise in temperature.

The fire resistance level is expressed in minutes and lists the three components as Structural Adequacy, Integrity and Insulation.

For example, an FRL of 90/90/90 means a minimum fire resistance period of 90 minutes each for structural adequacy, integrity and insulation. FRL’s can be determined from Australian Standard AS 3700 (Masonry Structures) or by testing in accordance with AS 1530.4.

The fire resistance level of a wall depends not only on the thickness of the wall but also on its height, length and boundary conditions (i.e. how it is connected to other building elements).

The Fire Resistance Levels expressed in this brochure are based on test results. Contact the Austral Bricks technical department for further details.

sound transmission

The National Construction Code (NCC) requires that building elements have certain levels of insulation from airborne noise and impact sound. R_w is the weighted sound reduction index, which is used to measure the acoustic performance of a construction system. It is a single number quantity for the airborne sound insulation rating of building elements. As the acoustic performance of a material or construction improves, the higher the R_w value will be.

The R_w rating system has two correction factors (C and C_{tr}) which take into account different spectra of noise sources. C relates mainly to high frequency noise while C_{tr} relates to lower frequency noises. These correction factors are used to indicate the performance drop of the wall in the corresponding frequency range.

For example, if a wall is measured as R_w (C; C_{tr}) of 55 (-1;-4) the R_w rating is 55 and $R_w + C_{tr}$ is 55 + (-4) = 51. $R_w + C_{tr}$ is the value of the index when the low frequency correction factor (C_{tr}) is applied. This brochure is designed to provide you with up to date data and information on the acoustic performances of Austral’s masonry wall systems.

Extensive sound testing at accredited facilities such as the CSIRO and National Acoustics Laboratories makes it possible for Austral to provide you with construction solutions to economically satisfy the sound insulation levels that you require. The following pages show wall constructions that have been tested and shown to comply with the NCC requirements. Further test certificates are available on request.

National Construction Code Acoustic Requirements

The National Construction Code (NCC) requires that walls separating sole-occupancy units in Class 1, 2 and 3 buildings are required to have an $R_w + C_{tr}$ of not less than 50. In addition, the construction must be discontinuous, if the wall separates a habitable room (living room, dining room, bedroom, study and the like) from a wet room (kitchen, bathroom, sanitary compartment or laundry).

Walls in Class 2 or 3 buildings that separate a sole-occupancy unit from a plant room, lift shaft, stairway, public corridor, public lobby or the like must have an R_w of not less than 50. If this wall separates a sole-occupancy unit from a plant room or a lift shaft, the construction must be discontinuous.

Discontinuous construction requires a minimum 20mm cavity between two separate leaves. If wall ties are to be used they must be resilient wall ties, which are available from Matrix Industries. (www.matrixindustries.com.au)

Construction: Habitable To Habitable
Requirements: $R_w + C_{tr} \geq 50$

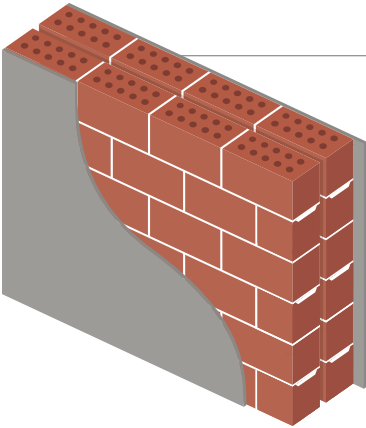

Construction: Habitable To Wet
Requirements: $R_w + C_{tr} \geq 50$ plus discontinuous construction.

Construction: Habitable To Corridor or Public Area
Requirements: $R_w \geq 50$ (plus discontinuous construction if lift shaft or plant room)
